

500 watt solar battery charger

What size charge controller for a 500W solar panel system?

the size of the charge controller for a 500W solar panel system depends on the voltage of your battery bank and whether you choose to undersize or oversize your charge controller. Increasing your battery voltage can make your charge controller and wiring cheaper.

Can I use a 30A charge controller with a 500W solar array?

For example, a 500W solar array has a charging current to the battery of 41.6A ($500W/12V=41.6A$) you can use a 30A charge controller without damaging it. You will damage a solar charge controller if you go over the maximum input voltage. You can also choose to have multiple charge controllers charging the same battery.

What is a solar charge controller?

Protect your 12 volt lead-acid or gel cell battery from overcharging and deep discharging with this 30 amp charge controller! The charge controller reduces overall system maintenance and prolongs the life of your battery. This solar charge controller or "charge regulator" also features a solar cell array voltage of 15-25 volts.

How many amps does a solar charge controller need?

This means, 500W of solar panels using a 12V battery needs a solar charge controller of 40 amps. If you have a 24V battery, you can halve this, and your charge controller will be cheaper too. We will talk about this more later in the article. Undersize or Oversize? A solar charge controller has a limit on the current output.

How to charge explorer 500 solar panel?

The Explorer 500 can be fully charged under straight full sun in 9.5 hours by connecting SolarSaga 100W solar panel. Solar recharging steps: 1. Find the DC interface on the back of SolarSaga 100; 2. Connect the DC interface of SolarSaga 100 with DC input of Explorer 500 1. Solar panel types and quantity depends on your purchase. 2.

Can I use a solar charge controller if my solar array is too big?

If your solar array is bigger than the current output of the charge controller it will limit its output. For example, a 500W solar array has a charging current to the battery of 41.6A ($500W/12V=41.6A$) you can use a 30A charge controller without damaging it. You will damage a solar charge controller if you go over the maximum input voltage.
