

Are solar batteries the future of energy storage?

Solar batteries present an emerging class of devices which enable simultaneous energy conversion and energy storage in one single device. This high level of integration enables new energy storage concepts ranging from short-term solar energy buffers to light-enhanced batteries, thus opening up exciting vistas for decentralized energy storage.

What is a solar battery?

The first groundbreaking solar battery concept of combined solar energy harvesting and storage was investigated in 1976 by Hodes, Manassen, and Cahen, consisting of a Cd-Se polycrystalline chalcogenide photoanode, capable of light absorption and photogenerated electron transfer to the S^{2-}/S redox couple in the electrolyte.

Are there scientific and engineering issues in advanced batteries?

However, despite significant progress in the research and development of advanced batteries, some scientific and engineering issues still remain to be resolved (Fig. 24). Fig. 24. Possible scientific and engineering directions for high energy density and high safety batteries.

Are bifunctional materials the most recent development in solar battery research?

By performing both light absorption and charge storage, bifunctional materials enable the most recent and highest level of material integration in solar batteries. To conclude, bifunctional materials are the most recent development in solar battery research.

Are advanced AB batteries a viable alternative to conventional lithium ion batteries?

Benefiting from their low cost, abundant resources, easy assembly and recycling, environmental benignity, and, above all, safety, the advanced ABs have potential to replace conventional Li-ion, Ni-MH, and Pb-acid batteries for future automotive, aerial, and scalable energy storage applications.

What is a bifunctional solar battery?

Since no external wires are required for photocharging and a BAM is employed, this solar battery design represents a very high level of integration. By performing both light absorption and charge storage, bifunctional materials enable the most recent and highest level of material integration in solar batteries.

This has led to an upswell in demand for storage of electrical energy, particularly in advanced batteries that have practical potential for grid-scale applications. Of particular research interest are the rechargeable lithium ion batteries (LIBs) (1).
