

Airport energy storage charging pile

How much does Airport Charge pile cost?

According to the survey, the price of charge pile used in airport was 1 million Yuan/set, while the ordinary one in resident area is generally 80000 Yuan/set. Installation cost of airport charging pile is also high. Government subsidy policy is mainly for charging piles used by the public, and less for airports.

How to predict demand for airport charging facilities/piles?

In order to predict the demand for airport charging facilities/piles, a demand prediction model was proposed for airports, which includes airside and landside of airports. The airside prediction model was calculated according to air traffic volume and vehicle pile ratio.

What is energy storage charging pile management system?

System Architecture Design Based on the Internet of Things technology, the energy storage charging pile management system is designed as a three-layer structure, and its system architecture is shown in Figure 9. The perception layer is energy storage charging pile equipment.

How many charging piles are planned to be built in airports?

Up to now, the number of charging piles planned to be built in airports has exceeded 500 and the planning investment from 2015 to 2018 has exceeded 120 million RMB. 3. Airport charging infrastructure demand forecast 3.1. Airside Demand of airport airside charging facilities was predicted by ratio of vehicle to pile.

How does the energy storage charging pile's scheduling strategy affect cost optimization?

By using the energy storage charging pile's scheduling strategy, most of the user's charging demand during peak periods is shifted to periods with flat and valley electricity prices. At an average demand of 30% battery capacity, with 50-200 electric vehicles, the cost optimization decreased by 18.7%-26.3% before and after optimization.

How do energy storage charging piles work?

To optimize grid operations, concerning energy storage charging piles connected to the grid, the charging load of energy storage is shifted to nighttime to fill in the valley of the grid's baseline load. During peak electricity consumption periods, priority is given to using stored energy for electric vehicle charging.
