

Can distributed generators and battery energy storage systems improve reliability?

In this paper, Distributed Generators (DGs) and Battery Energy Storage Systems (BESSs) are used simultaneously to improve the reliability of distribution networks.

How a distributed battery system can improve the cost-effectiveness of solar power?

By taking advantage of energy sharing, the proposed design can improve the cost-effectiveness of distributed battery system in solar powered building community. Impacts of capacity on performances: With battery capacity increases, the electricity cost savings will increase as more PV power can be kept on-site.

How does a distributed battery configuration affect community-level self-consumption rates?

This is because in the distributed battery configuration, the buildings can use their own batteries as part of the electricity storage and thus reduce the need of storage sharing. Such reduced energy loss in storage sharing contributed to a slight increase in the community-level self-consumption rates (i.e. about 0.3% as shown in Fig. 7 (b)).

How can distributed energy storage systems be optimally allocated?

Optimal allocation of distributed energy storage systems is investigated. A uniform and non-uniform energy storage system sizes approaches are employed. Voltage profile is improved; flickers, line loading, and line losses are minimized. ESS sizing is accomplished through PQ injection by the ESSs.

How to optimize distributed batteries in solar power shared building community?

This study has proposed a hierarchical design optimization of distributed batteries in solar power shared building community. The developed design method first considers all the distributed batteries as a virtual 'shared' battery and searches the optimal capacity of the virtual 'shared' battery using genetic algorithm.

How do distributed batteries reduce energy loss?

The developed design method first considers all the distributed batteries as a virtual 'shared' battery and searches its optimal capacity using genetic algorithm. Taking the optimized capacity as a constraint, the developed method then optimizes the capacities of the distributed batteries for minimizing the energy loss using non-linear programming.
