

What is the research status of different energy storage dielectrics?

The research status of different energy storage dielectrics is summarized, the methods to improve the energy storage density of dielectric materials are analyzed and the development trend is prospected. It is expected to provide a certain reference for the research and development of energy storage capacitors.

Which method is best for preparing nonlinear polymer dielectrics?

Among the three methods for preparing nonlinear polymer dielectrics, multilayer structure allows for the highest energy density ($U_e \approx 20 \text{ J/cm}^3$) and breakdown strength ($E_b \approx 500 \text{ MV/m}$) in all-organic polymer dielectrics, but the energy storage efficiency is low.

How do polymer dielectric energy storage materials improve energy storage capacity?

The strategy effectively suppresses electron multiplication effects, enhancing the thermal conductivity and mechanical modulus of dielectric polymers, and thus improving electric energy storage capacity. Briefly, the key problem of polymer dielectric energy storage materials is to enhance their dielectric permittivity.

What is the energy density of dielectric energy storage materials?

Briefly, exciting progress has been reached in the research field of dielectric energy storage materials, i.e., an energy density of $\approx 30 \text{ J cm}^{-3}$ and $\approx 4 \text{ J cm}^{-3}$ at room temperature and high temperature conditions, respectively, can often be acquired through ingenious design.

Why do dielectric energy storage materials have a high UE?

In addition, there is a positive correlation between the polarization and the relative permittivity (ϵ_r), the dielectric materials withstand the upper limit of the exerted electric field, which is called breakdown strength (E_b). Accordingly, the dielectric energy storage materials that possess concurrent high ϵ_r and E_b are desired for high U_e .

How does a polymer based dielectric work?

The conventional method employs inorganic fillers, such as ceramic particles, to fill the polymer matrix, resulting in a two-phase composite material composed of inorganic particles and polymer to improve the energy storage characteristics of the polymer-based dielectric.
