Can polymer-based dielectric films improve high-temperature energy storage performance?

Both the discharged energy density and operation temperature are significantly enhanced, indicating that this efficient and facile method provides an important reference to improve the high-temperature energy storage performance of polymer-based dielectric films.

Do coated PI films have high field energy storage performance at 175 °C?

We then explored the high field energy storage performance of coated PI films at 175 °C using the electric displacement-electric field loop (DE loop) method.

How does temperature affect energy storage performance?

However, leakage current and conduction loss significantly increase at elevated temperatures and highly applied electric fields and cause a sharp deteriorating energy storage performance and lifetime [15, 18].

Can grafting modification improve high-temperature energy storage performance of commercial BOPP films?

In this study, the grafting modification method is facile and suitable for large-scale industrial manufacturing and has been proposed to increase the high-temperature energy storage performance of commercial BOPP films for the first time.

What is the energy storage density of metadielectric film capacitors?

The energy storage density of the metadielectric film capacitors can achieve to 85 joules per cubic centimeter with energy efficiency exceeding 81% in the temperature range from 25 °C to 400 °C.

Can MD design improve high-temperature energy storage performance?

To demonstrate the effectiveness of the MD design for improving high-temperature energy storage performance, we first conducted phase-field simulations (as described in the "Methods" section) to study the polarization response and dielectric breakdown process at high temperatures.
