

What is a passive precharge circuit?

At a high level, a passive precharge circuit is a simple RC circuit that can be represented as an exponentially decaying function. The voltage on the capacitor is calculated using Equation 1: For this system, the precharge cycle is considered complete when the 5 τ has passed.

What is a pre-charge circuit?

High voltage (HV) positive and negative contactors are used in this system to act as an emergency disconnect when the motor regulator fails. Without a pre-charge circuit, welding can occur within the contactor as it closes and there could be a brief arc resulting in pitting. Figure 1. Pre-charge Initial State

Does a PV battery need a pre-charge?

In most PV applications, pre-charge of the Inverter DC bus capacitance is not required due to the I-V characteristic of the PV cell. The inherent current limit of the PV array will limit the current inrush on the inverter bus to acceptable levels. Batteries have extremely high short circuit capacities.

Why do batteries need a DC pre-charge unit?

Batteries have extremely high short circuit capacities. This results in them being able to provide an extremely high peak inrush current to the inverter DC bus. This inrush current needs to be mitigated with the use of DC pre-charge assemblies. Dynapower's CPS and DPS product lines come with integrated pre-charge units.

How do you energize a high voltage power supply?

Attach the high-voltage power supply positive lead to J1 and the negative to J4. Connect an isolated probe to S1-HV- to measure the voltage across the capacitor as the capacitor charges. Connect an isolated probe to VDRV-VSSS to show the step of the drive pin. Close the enclosure and energize the high-voltage power supply.

How many volts can an EV carry at full charge?

However, 800V EVs can carry as much as 1000V at full charge, so the components in the design must be sized accordingly. At a high level, a passive precharge circuit is a simple RC circuit that can be represented as an exponentially decaying function. The voltage on the capacitor is calculated using Equation 1:
