

Energy storage inverter test standards

How a comprehensive energy storage system certification is conducted?

Our comprehensive energy storage system certification is conducted according to the following five-step approach: Our global network of experts is extensively experienced in the cross-industry inspection, testing and certification of energy storage systems.

What are GFM IBR requirements for stand-alone energy storage systems?

MISO is proposing a framework of GFM IBR requirements for stand-alone energy storage systems. This framework has two parts: 1) several functional capability and performance requirements defining voltage source characteristics; and 2) required simulation tests to demonstrate GFM characteristics and stable control responses.

Why do you need a certified energy storage system?

Energy storage systems that have been tested and certified ensure reliable customer service, protect the natural environment and provide profits needed for business success. Selecting an experienced and recognized independent partner to certify energy storage systems and components demonstrates your corporate commitment to excellence.

How do inverters work in energy storage?

Energy storage, like wind and solar, uses inverters for converting direct current to alternating current to interface with the grid. Industry has historically classified inverter control technology as "grid-following" (GFL) or "grid-forming" (GFM) to represent the bookends of control characteristics, capabilities, and performance.

What is universal interoperability for grid-forming inverters (unifi)?

The Department of Energy funded Universal Interoperability for Grid-Forming Inverters (unifi) Consortium, a multi-year effort underway to advance GFM technology, produced the second version of GFM specifications in March 2024. MISO reviewed and adopted several aspects of this work in requirements and guidance as well.

What is energy storage resource (ESR)?

70 Energy Storage Resource (ESR) is a defined term in ERCOT. Two GFM IBR dynamic models used in these tests were developed by Pacific Northwest National Laboratory (PNNL) and Electric Power Research Institute (EPRI).⁷² Both phasor domain models and EMT models from these two entities showed similar performance in the study.
