

European energy storage demand falls

What is the future of energy storage in Europe?

The European energy storage market contracted in 2019 to 1 GWh, with a cumulative installed base of 3.4 GWh across all segments. However, the future of energy storage in 2020 in Europe remains positive as the energy transition progresses.

What is the European market outlook for battery storage?

The European Market Outlook for battery storage shows that growth comes from the rising demand for effective energy storage. This is key for using renewable energy sources like solar and wind. These statistics underline the importance of energy storage in achieving the region's climate goals.

What percentage of Europe's energy storage capacity is pumped hydro?

However, despite an exponential growth in Europe's battery energy storage capacity, which reached 36 gigawatt-hours in 2023, pumped hydro still accounted for 90 percent of the electricity storage capacity in the European Union that year.

Does Europe have a battery storage market?

Europe's battery storage market faces global competition. China led installations in 2023 with 35 GWh deployed, backed by large subsidies and supply chain dominance. The United States aims to deploy 700 GWh of energy storage capacity by 2030, as recommended by the Solar Energy Industries Association (SEIA).

Why is energy storage important in the EU?

It can also facilitate the electrification of different economic sectors, notably buildings and transport. The main energy storage method in the EU is by far 'pumped hydro' storage, but battery storage projects are rising. A variety of new technologies to store energy are also rapidly developing and becoming increasingly market-competitive.

What is the future of energy storage in Norway?

Norway's poor lighting conditions, residential PV and energy storage development are limited, the future market may mainly focus on the outlying island microgrid. Spain will install 242 MW of energy storage in 2023 and is expected to increase to 5.8 GW by 2030.
