

MW scale storage system cost vs benefit calculation in Iraq

What are base year costs for utility-scale battery energy storage systems?

Base year costs for utility-scale battery energy storage systems (BESSs) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2023). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation.

What does MW mean in a battery?

Usable energy divided by power rating (in MW) reflects hourly duration of system. This analysis reflects common practice in the market whereby batteries are upsized in year one to 110% of nameplate capacity (e.g., a 100 MWh battery actually begins project life with 110 MWh).

How much does storage cost?

The corresponding levelized cost of storage for this case would be \$1,613/MWh - \$3,034/MWh. The scope of revenue sources is limited to those captured by existing or soon-to-be commissioned projects. Revenue sources that are not identifiable or without publicly available data are not analyzed.

Developer premiums and development expenses - depending on the project's attractiveness, these can range from \$50k/MW to \$100k/MW. Financing and transaction costs - at current interest rates, these can be around 20% of total ...
