

# New energy vehicle heat pump energy storage

Can a heat pump-based fuel cell electric vehicle thermal management system save energy?

The results show that compared to the baseline, a Hyundai system using cathode oxygen depletion (COD) heater heating coolant, the proposed system can save 27.3% of time consumption and 9.3% energy to arrive at a suitable operating temperature of 25 °C at -20 °C. Fig. 35. A heat pump-based fuel cell electric vehicle thermal management system.

Does a novel electric vehicle thermal management system reduce battery preheating energy consumption?

A novel electric vehicle thermal management system was proposed. The proposed system greatly reduces the battery preheating energy consumption. The characteristics of CO<sub>2</sub> heat pump waste heat were investigated. The matching of PCM heat storage was studied. The thermal management system plays a pivotal role in electric vehicle.

Can an integrated thermal management system improve EV heating performance during winter?

**Conclusion** This study proposes and investigates a novel integrated thermal management system for electric vehicles, combining the CO<sub>2</sub> heat pump system with the battery thermal management system through the PCM heat storage coupling. The primary objective of this integration is to enhance the EVs heating performance during winter conditions.

Can a PCM heat storage system recover waste heat from CO<sub>2</sub> heat pump?

This paper proposes a thermal management system that utilizes PCM heat storage to recover waste heat from the CO<sub>2</sub> heat pump. The system aims to insulate the battery during winter parking, reducing the battery's preheating energy consumption and enhancing the vehicle's overall energy utilization efficiency.

Which heat pump integrated thermal management system compared with coolant heat recovery system?

EV thermal system. Lee et al. introduced and compared three heat pump integrated thermal management systems with coolant heat recovery systems. Three systems are conventional heat pump waste heat recovery system (CWHRS), multi-stage heat pump waste heat recovery system (MWHRS), and direct waste heat recovery system (DWHRS).

Can an air source heat pump be used for EV?

In 2021, Li et al. designed a new air source heat pump system for EVs shown in Fig. 21. It has two bypass valves that can significantly reduce the components and cost. The introduced system can provide a 13% higher maximum peak heating capacity when air volume is 300 m<sup>3</sup>/h, compared to a normal heat pump system with 400 m<sup>3</sup>/h at -10 °C.
