Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($<10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

What is thermal energy storage (TES) with phase change materials (PCM)?

Thermal energy storage (TES) with phase change materials (PCM) was applied as useful engineering solution to reduce the gap between energy supply and energy demand in cooling or heating applications by storing extra energy generated during peak collection hours and dispatching it during off-peak hours.

What are phase change materials (PCMs)?

Phase Change Materials (PCMs) are substances that change their physical state without a change in temperature and can provide latent heat. In phase change thermal energy storage technology, PCMs play a crucial role in determining the performance of the energy storage system.

What are the performance limitations of phase change thermal energy storage materials?

Material Performance Limitations: Despite the development of various phase change thermal energy storage materials, several performance shortcomings remain. Many materials have insufficient phase change latent heat, failing to meet the high energy density requirements of large-scale energy storage.

What are the selection criteria for thermal energy storage applications?

In particular, the melting point, thermal energy storage density and thermal conductivity of the organic, inorganic and eutectic phase change materials are the major selection criteria for various thermal energy storage applications with a wider operating temperature range.

Which materials are suitable for phase change storage?

This is the largest category of candidate's materials for phase change storage. Abhat et al. and Buddhi and Sawhney have conducted an extensive survey of organic materials and identified a number of esters, fatty acids, alcohol's and glycol's suitable for energy storage.
