

What are the three types of energy storage equipment?

Energy storage system The integrated energy system studied in this paper includes three types of energy storage equipment: electricity storage (EST),thermal storage tank (TST),and gas storage tank (GST).

How do energy storage systems work?

Energy storage systems involve charging and discharging energy constraints,upper and lower capacity constraints,and maximum and minimum capacity constraints.

Does excess electricity heat storage affect Ries multi-objective synergy planning?

Thermal storage equipment is mostly used in conjunction with EB. This paper solely investigates the impact of the "excess electricity heat storage" strategy for TST on RIES multi-objective synergy planning,in which results show that this strategy reduces 19.16% - 28.55% TEAR and 0.05M\$-0.36M\$ATCs.

How much electricity is stored in est?

The total annual electricity purchase is 25938.20 GWh,of which 14.32% is dual storage,85.68% is normal time-sharing. EST stores 10999.48 GWh electricity and discharges 10995.56 GWh throughout the year. Among electricity stored in EST,86.62% is excess electricity generated by WT and PV,13.38% is purchased from grid.

Does equipment capacity affect energy interaction in Ries synergy planning?

This paper designs equipment capacity in energy interaction,which leads RIES synergy planning to a more specific and practical direction,achieves the extension and supplement to the previous research.

Does EB & TST's 'excess electricity heat storage' strategy work?

In terms of the equipment output strategies, findings indicate that with EB + TST's "excess electricity heat storage" strategy, RIES not only enjoys the benefits of the peak-to-valley price difference, but also removes peak to fill valley, leveling load fluctuations.
