How much does a VRFB cost?

To validate our model outputs, we compare our base case to other LCOS models of VRFBs in the open literature. Lazard's annual levelized cost of storage analysis is a useful source for costs of various energy storage systems, and, in 2018, reported levelized VRFB costs in the range of 293-467 \$/MWh (for mid-scale systems ~10 MWh).

Can a VRFB be rebalanced?

In contrast, VRFBs can be rebalanced to restore lost capacity without additional capital expenditure. Thus, while VRFBs have significantly higher capacity fade rates than state-of-the-art Li-ion batteries, the resilience of the VRFB electrolyte may lead to cost savings over the project lifetime.

Can a three tank system be used in a VRFB?

A three-tank system can be used, typically with a one-pass flow through configuration at the electrode, in which two supply tanks lead to a single storage tank for the mixed electrolyte, but this system is inefficient for the same reasons as a one-pass flow through model. Ideally, the tank system within a VRFB will be sealed.

What is a redox flow battery (VRFB)?

The most promising, commonly researched and pursued RFB technology is the vanadium redox flow battery (VRFB). One main difference between redox flow batteries and more typical electrochemical batteries is the method of electrolyte storage: flow batteries store the electrolytes in external tanks away from the battery center.

How do you recover a lost capacity in a VRFB?

The primary method for recovering the lost capacity in VRFBs is termed rebalancing, where the negative and positive electrolytes are mixed to equilibrate the concentration of vanadium ions in each electrolyte. Rebalancing is generally performed once the accessible capacity drops to a predefined level that is determined by application requirements.

Is long-term VRFB cycling data available?

It is important to note the limited amount of long-term VRFB cycling data in the open literature as compared to shorter-term cell tests (i.e. cyclic voltammograms, IV polarizations, etc.), likely because cycling analyses are both more time-consuming and experimentally challenging.

Redox flow batteries (RFBs) can store energy for longer durations at a lower levelized cost of storage versus Li-ion. Demand for long duration energy storage technologies is expected to increase to facilitate increasing variable renewable ...
