

# What is the profit analysis code for an independent energy storage power station

What is a flexible energy storage power station (fesps)?

Firstly, this paper proposes the concept of a flexible energy storage power station (FESPS) on the basis of an energy-sharing concept, which offers the dual functions of power flow regulation and energy storage. Moreover, the real-time application scenarios, operation, and implementation process for the FESPS have been analyzed herein.

What time does the energy storage power station operate?

During the three time periods of 03:00-08:00, 15:00-17:00, and 21:00-24:00, the loads are supplied by the renewable energy, and the excess renewable energy is stored in the FESPS or/and transferred to the other buses. Table 1. Energy storage power station.

Can a shared energy storage concept perform dual functions of power flow regulation?

This paper proposes an FESPS developed on the basis of a shared energy storage concept, which can execute the dual functions of power flow regulation and energy storage.

When does the energy storage system choose not to discharge?

When the grid price is in the valley period, such as 15:00-18:00, the energy storage system chooses not to discharge regardless of the power shortage. Thereafter, the energy storage system initiates the discharging mechanism when the grid price is in the peak period starting period of 18:00.

What is energy storage/reuse based on shared energy storage?

Energy storage/reuse based on the concept of shared energy storage can fundamentally reduce the configuration capacity, investment, and operational costs for energy storage devices. Accordingly, FESPS are expected to play an important role in the construction of renewable power systems.

What are the limitations of a distributed power generation system?

In addition, the operation of equipment for distributed power generation is limited by the energy consumption, external environment, and other constraints, resulting in an idle or redundant energy supply capacity.
